Popular Math Brain Teasers with Answers

This section presents a selection of classic brain teasers for maths with answers, illustrating the variety and complexity of puzzles available. Each problem is followed by a detailed solution to aid understanding.

1.

Riddle: What number comes next in the sequence: 2, 6, 12, 20, 30, ?

Answer: 42

Explanation: The differences between terms increase by 2 each time: 4, 6, 8, 10, so the next difference is 12. Adding 12 to 30 gives 42.

2.

Riddle: If you multiply this number by any other number, the answer will always be the same.
What number is it?

Answer: 0

Explanation: Multiplying zero by any number results in zero.

3.

Riddle: A bat and a ball cost \$1.10 in total. The bat costs \$1 more than the ball. How much does the ball cost?

Answer: \$0.05

Explanation: Let the ball cost x dollars. Then the bat costs $x + 1$. Total cost: $x + (x + 1) = 1.10$.

Solving: $2x + 1 = 1.10 \implies 2x = 0.10 \implies x = 0.05$.

4.

Riddle: How many times can you subtract 5 from 25?

Answer: Once

Explanation: After subtracting 5 once, the number becomes 20. Subtracting 5 again is from 20, not 25.

5.

Riddle: Using only addition, add eight 8s to get the number 1000.

Answer: $888 + 88 + 8 + 8 + 8 = 1000$

Explanation: By placing the eights strategically and adding them, the sum equals 1000.

Frequently Asked Questions

What is a popular math brain teaser involving ages?

A classic math brain teaser is: 'A father is three times as old as his son. After 5 years, he will be twice as old as his son. How old are they now?' The answer is: The son is 5 years old, and the father is 15 years old.

Can you give an example of a number pattern brain teaser with solution?

Example: 'What is the next number in the sequence: 2, 6, 12, 20, 30, ?' The answer is 42, since the pattern adds consecutive even numbers: +4, +6, +8, +10, +12.

How do you solve the classic river crossing math brain teaser?

In the classic river crossing puzzle, you move items across the river without leaving incompatible items alone. The solution involves moving items in a specific order to ensure safety. For example, taking the wolf across first, then returning with the goat, and so on.

What is a challenging math brain teaser involving coins and how to solve it?

Teaser: 'You have 10 coins totaling \$1.00. One of them is not a nickel. How is this possible?' Answer: The phrase 'One of them is not a nickel' is tricky. It means only one coin is not a nickel; the other nine

can be nickels. So, nine nickels (45 cents) plus one 55-cent coin (which doesn't exist) is impossible. The real solution: The statement is misleading; actually, one coin is a dime, and the rest are nickels, totaling \$1.00.

What is an example of a logic-based math brain teaser with its answer?

Teaser: 'I am a three-digit number. My tens digit is five more than my ones digit. My hundreds digit is eight less than my tens digit. What number am I?' Answer: The number is 194. Explanation: Let the ones digit be x , tens digit = $x + 5$, hundreds digit = $(x + 5) - 8 = x - 3$. Since digits are 0-9, x must be 4, so tens digit = 9, hundreds digit = 1.
