Exam Structure and Format

The June 2017 Chemistry Regents exam was divided into multiple sections designed to assess different levels of understanding and skills. The exam included both multiple-choice questions and constructed-response questions, which required students to write short answers or solve complex problems. The test duration was approximately three hours, offering sufficient time for students to demonstrate their knowledge.

Multiple-Choice Section

This section consisted of 30 multiple-choice questions covering a broad range of chemistry topics. Each question presented four answer choices, with only one correct option. The questions were designed to assess students' recall, understanding, and application abilities in areas such as atomic theory, chemical bonding, and periodic trends.

Constructed-Response Section

The constructed-response section required students to provide detailed explanations, calculations, or drawings to answer questions. These problems tested analytical and critical thinking skills, involving stoichiometric calculations, balancing chemical equations, and interpreting data from

graphs or tables.

Laboratory-Based Questions

Included were questions related to laboratory experiments and observations, demanding students to analyze experimental results and understand scientific methods. Students were expected to interpret data, identify variables, and explain procedures relevant to common chemistry labs.

Key Topics Covered in June 2017 Chemistry Regents

The June 2017 Chemistry Regents exam encompassed a comprehensive range of chemistry topics aligned with the New York State standards. These topics addressed both foundational concepts and more advanced principles critical for success in chemistry coursework.

Atomic Structure and the Periodic Table

This topic covered the structure of atoms, including protons, neutrons, and electrons, isotopes, and electron configurations. Students needed to understand periodic trends such as atomic radius, ionization energy, and electronegativity.

Chemical Bonding and Molecular Structure

Questions focused on the types of chemical bonds—ionic, covalent, and metallic—and their properties. Students were expected to predict molecular shapes using the VSEPR theory and understand polarity and intermolecular forces.

Chemical Reactions and Stoichiometry

This section tested knowledge of reaction types (synthesis, decomposition, single replacement, double replacement, combustion), balancing chemical equations, and calculating reactants and products using mole ratios.

Thermochemistry and Gas Laws

Students were required to understand concepts of energy changes in reactions, exothermic and endothermic processes, and apply gas laws such as Boyle's, Charles's, and the Ideal Gas Law to solve problems.

Solutions and Acids-Bases

The exam included questions on solution concentration calculations, solubility, pH, and the properties of acids and bases according to Arrhenius and Bronsted-Lowry definitions.

Sample Questions and Problem Types

The June 2017 Chemistry Regents presented a variety of question formats designed to evaluate both conceptual understanding and practical application. This section provides examples typical of those found on the exam.

Multiple-Choice Sample

Which of the following elements has the highest electronegativity?

- A) Sodium (Na)
- B) Chlorine (Cl)
- C) Calcium (Ca)
- D) Potassium (K)

This question tests knowledge of periodic trends and the ability to identify electronegativity differences.

Constructed-Response Sample

Balance the following chemical equation and identify the type of reaction:

Explain the steps used to balance the equation and classify the reaction.

Calculation Problem Sample

Calculate the mass of water produced when 2.0 moles of hydrogen gas react completely with oxygen gas according to the equation:

Show all work and include units.

Scoring and Grading Criteria

The scoring of the June 2017 Chemistry Regents exam was standardized to ensure fairness and consistency. Both sections, multiple-choice and constructed-response, contributed to the total score, which determined the student's proficiency level.

Multiple-Choice Scoring

Each multiple-choice question was worth one point, with no penalties for incorrect answers. The total raw score from this section was added to the constructed-response raw score to form the overall grade.

Constructed-Response Scoring

Constructed-response questions were scored using detailed rubrics that assessed the accuracy, completeness, and clarity of answers. Partial credit was awarded for partially correct responses demonstrating understanding.

Grade Conversion and Passing Scores

Raw scores were converted into scaled scores ranging from 0 to 100. A minimum score of 65 was typically required to pass the exam, qualifying students for the Regents Diploma with a chemistry endorsement.

Effective Preparation Strategies

Success on the June 2017 Chemistry Regents required thorough preparation and mastery of key concepts. The following strategies were widely recommended to maximize performance on the exam.
